FOOD CONSUMPTION OF HOUSEHOLDS IN THE

SOUTH

SPRING 1965

U.S. Department of Agriculture Agricultural Research Service

Issued July 1968

U.S. Department of Agriculture National Agricultural Library Division of Lending Beltsville, Maryland 20705

ACKNOWLEDGMENTS

The 1965-66 nationwide survey of household food consumption was conducted by the Consumer and Food Economics Research Division, Agricultural Research Service, U.S. Department of Agriculture. The sample was designed and the data were collected and processed by National Analysts, Inc., under contract with the Department. The data were tabulated by the General Electric Company, also under contract with the Department.

Work on the survey was the concern of many individuals in the Consumer and Food Economics Research Division. Sadye F. Adelson and Evelyn Grossman had major responsibility for the planning and supervision of the study. The staff members who collaborated with them in the conduct of the survey and the preparation of this report included: Elizabeth Davenport and Ennis C. Blake, responsible primarily for monitoring

the technical subject matter aspects of the data processing and tabulation performed by the contractors; Dorothy A. Baker, Arletta Beloian, Jessie Brooks. Lillian Fincher, Carolyn Hoge, Corinne LeBovit, and Constance Ward, who participated in developing plans for coding and tabulating the data, analyzing the findings, and writing this report.

To insure consideration of the needs of potential users, many were invited during the planning of the survey to make their data needs known and to contribute their ideas. To this end special attention was given by staff members of the Economic Research Service, the Statistical Reporting Service, and the Consumer and Marketing Service of the U.S. Department of Agriculture, as well as staff members of other Federal agencies.

The study was carried out under the general direction of Faith Clark, Director of the Consumer and Food Economics Research Division, Agricultural Research Service.

FOOD CONSUMPTION OF HOUSEHOLDS IN THE SOUTH, SPRING 1965

Prepored by Consumer and Food Economics Research Division, Agricultural Research Service, United States Department of Agriculture

HIGHLIGHTS

The money value of food used by housekeeping households in the South averaged \$31 per week in the spring of 1965. Of this amount, \$26 was the value of food used at home and more than \$5 was the expense for meals and snacks eaten away from home. The value of food used at home can be further divided into food bought-\$23-\(^2\)-and food received without direct expense--nearly \$3. Most of the food received without direct expense was home produced.

The average size of the households was 3.28 persons, making the per person averages for food for one week as follows:

All food	\$9.55
Money value of food used at home	7.92
Bought	7.13
Received without direct expense (home	
produced, federally donated, and received	
as a gift and as pay)	. 79
Expense for meals and snacks eaten away	
from home	1.63

These figures include the money value of alcoholic beverages, soft drinks, and all items commonly thought of as food. They do not include cigarettes, soaps, and other nonfood items purchased in grocery stores.

All families surveyed bought some of the food they used at home. Some families, 43 percent, used food that was produced at home; 42 percent had some food that was received as a gift or pay; and 4 percent had some food that was federally donated.

Seventy percent of the families bought meals and snacks in restaurants and other eating establishments. Cost of eating out averaged \$5.35 per family. A third of the families had free meals, received as guests or as pay.

Averages conceal the great variation among families. For example, the average money value of food used at home in a week by families in the South was \$7.92 per person. But for about two in five families, the value of a week's food was less than \$7 per person and for another two in five families, \$9 or more per person.

The largest part of the home-food dollar, 36 cents, went for meat, poultry, fish, and eggs. The next largest part, 19 cents, went for vegetables and fruit, inluding juices. About 12 cents was used for milk and milk products other than butter, 12 cents for flour, cereals, and bakery products, and 9 cents for beverages such as coffee, tea, soft drinks, punches, ades, beverage powders, and alcoholic beverages. Fats, sweets, and all other foods accounted for the remaining money.

The average consumption of food at home per person per day included 10-1/4 ounces of meat, poultry, and fish (about two servings a day); about one large egg; slightly over 2 cups of milk or its equivalent in milk products (in terms of calcium content); a little over 3 ounces of potatoes and sweetpotatoes; a little over one pound of vegetables and fruit, including juices; about 3-1/4 slices of bread and 2-1/4 ounces of other bakery products; 4-1/2 ounces of flour and cereal products; 3 ounces of sugar and other sweets; a little over 2 ounces of fats, oils, and salad dressings; plus varying amounts of beverages, nuts, mixtures, and condiments.

Regional Differences¹

In spring 1965, the money value of food used at home and the expense for food away from home averaged highest in the Northeast and lowest in the South.

	Per	r household	d per week		
Item	Northeast	North Central	South	West	
	Dollars	Dollars	Dollars	Dollars	
Money value of all food	39.32	35.04_	31.33	35.79	
Money value of food at home	32.06	29.30	25.98	29.25	
Bought	31.01	27.06	23.39	27.69	
Home produced	.43	1.66	1.76	.85	
Expense for food away from home	7.26	5.74	5.35	6.53	
Household size (21 meals at home = 1 person)	3.28	3.38	3.28	3.13	

The average money value of food at home per person per week ranged from \$7.92 in the South to \$9.77 in the Northeast, a difference of \$1.85.

About 70 percent of the families in each region had some meals or snacks away from home. However, there was a difference of nearly \$2 per household per week between the South, with the lowest average expense for eating out, and the Northeast, with the highest.

^{1/}Data on food consumption of households in each of the four regions are given in separate reports. The reports are listed under, "Publications in Series."

Southern families differed from those in the other regions in consumption of some of the major food groups. They had higher consumption of fats and oils, flour and cereal, eggs, and sugar and sweets than those in the other regions. The foods in these groups are ingredients used in bread, rolls, biscuits, cake, pie, and other mixtures. Probably the Southern families made more of these foods at home than families in the other regions. Use of milk and milk products was considerably lower in the South than in the other regions, about a pint less per person per week. Southern families also used less fruit, a half pound to a pound less per person per week. They used almost as much meat, poultry, and fish as households in the other regions.

T 2	Per person per week							
Food group	Northeast	North Central	South	West				
Milk, cream, cheese (calcium equivalent)	.49 .97 1.68 3.50	4.20 .78 1.20 2.38 4.68 .55 1.08 1.88 3.33 3.76 .63	3.74 .94 1.95 2.13 4.48 .61 1.33 1.48 3.81 3.20 .46	4.23 .77 1.31 2.20 4.58 .58 1.01 1.39 3.73 4.01				

Regional preferences for certain foods were evident. Some foods used in markedly larger quantities in certain regions than in others were:

Region	Specified foods
Northeast	Fresh whole milk, butter, lamb, veal, shell-fish, fresh fruit, fruit juice.
North Central	Fresh whole milk, cheese, butter, beef, pork, lunch meat, fresh white potatoes, commercially canned fruit, commercially frozen fruit.
South	Evaporated milk, lard, vegetable shortening, pork, chicken, fish, sweetpotatoes, rice, cornmeal, hominy grits, self-rising flour, sirup and molasses.
West	Skim milk, cheese, beef, fresh fruit, commercially canned fruit, dried fruit.

Urbanization Differences

Farm families in each region had the highest money value for food at home. But, on a per person basis, urban families with their smaller average size had food worth more than farm families in every region but the West. In the Northeast, food averaged \$10.12 per person for urban households and \$8.63 for farm households. In the other regions the differences between the money value of food of urban and farm households were less. Rural nonfarm families were generally between the urban and farm families in both average household size and money value of home food. The West was an excep-

tion. In this region, the money value of food per person was highest on farms (\$9.62) and lowest in rural nonfarm areas (\$8.27).

In every region, farm families raised a large part of their home food whereas urbanfamilies purchased nearly all of theirs. Home-produced food accounted for about a third of the money value of food on farms in the South and North Central, and a fourth in the Northeast and West.

Average expense for food away from home was lowest on farms, highest in urban areas, and in-between in rural nonfarm areas in each region. The spread between farm and urban expense was greatest in the Northeast--\$3.91 per household per week for farm households compared with \$7.80 for urban households. In the South, comparable averages were \$3.91 and \$5.90.

Data for the Northeast, North Central, and West were combined into one region, the North, to simplify discussion of urbanization and income differences by region.

In both the North and South, farm households tended to use more of each of the major groups of food per person than either urban or rural nonfarm households--milk and milk products (calcium equivalent), fats and oils, grain products (flour equivalent of bakery products plus flour and cereals), meat, poultry, and fish, eggs, sugar and sweets, and vegetables and fruit including potatoes and sweetpotatoes. The only exceptions occurred in the South where urban households used more vegetables and fruit, and meat, poultry, and fish than farm households. In the South, only slight differences occurred by urbanization in per person use of milk and milk products and eggs.

In both the North and South, urban families tended to select more commercially prepared foods and farm families more ingredients for home-prepared foods.

	Per person per week							
Selected foods	Nort	h <u>l</u> /	South					
	Urban	Farm	Urban	Farm				
Urban families used more Vegetables:	Pounds	Pounds	Pounds	Pounds

Sugar	. 56	1.10	.78	1.15				

^{1/} Northeast, North Central, and West.

Income Differences

Regardless of region, households at each successively higher income level tended to have food at home with a greater money value. The money value of food at home averaged about \$8 per person per week for households in the North with incomes under \$3,000 and about \$11 for those with incomes of \$10,000 and over. Income made a greater difference in the South, averages for these income groups being about \$6 and \$11.

Home production contributed most to the money value of food of low-income farm families. Farm families in the North Central and South produced more of their food than

in the Northeast and West. Farm families in the North Central having incomes under \$3,000 produced 39 percent of their home food, those with \$10,000 and over, 27 percent. For comparable income groups in the South, the percentages were lower, 38 and 22.

For food away from home, families spent seven or eight times as much at the highest as at the lowest income level, about \$14.50 against under \$2 in the North, and about \$13 against under \$2 in the South.

In both the North and South, high-income households usually had more milk and milk products; meat, poultry, and fish; and vegetables and fruit per person than low-income households. On the other hand, low-income households used more grain products and sugar and sweets.

In high-income diets in both the North and South, food items more abundant were fresh fluid milk (both whole and skim), ice cream, cheese, butter, oils, salad dressing, bakery products except bread, beef, shellfish, processed potatoes, soup and other mixtures, fruit, fruit juice, fresh vegetables (total and deep-yellow), and commercially frozen vegetables. While in the low-income diets, evaporated milk, nonfat dry milk, cooking fats, flour, cereals and meals and pastes, fresh dark-green and leafy vegetables, sugar, and dried vegetables were more abundant. There was little relation, if any, between income and use of pork, lunch meat, chicken, peanut butter, and commercially canned vegetables.

Low-income households in the North, in general, used more processed and relatively expensive foods than those in the South.

Food Consumption in 1955 and 1965

The section, "Comparison With 1955 Household Food Consumption Survey," gives the variations in collection and tabulation that might affect comparability of the 1955 and 1965 data. In addition, it gives some data on food consumption for this region for the two survey periods.

Between 1955 and 1965 the average money value of food used at home increased 21 percent in the Northeast, 18 percent in the South, and 10 percent in both the West and North Central. The increase in the expense for food away from home ranged from 16 percent in the North Central to 63 percent in the South. During the same decade, city prices for food used at home, as measured by the Bureau of Labor Statistics Consumer Price Index, rose 13 percent and for food eaten away from home 28 percent.

Average size of household remained about the same in all regions except in the South, where households were 7 percent smaller.

Home-food production declined on farms in each region during the decade. The greatest decrease in the share of all food that was home produced on farms was in the Northeast. In this region, home-produced food dropped from 38 percent in 1955 to only 25 percent in 1965. The West had the smallest decline, from 33 to 27 percent.

Shifts occurred in the quantities and types of foods used by households between 1955 and 1965. Changes tended to occur in all four regions in use of the same foods and in the same direction, although not always to the same extent.

The Northeast had the smallest drop in the consumption of milk and milk products (calcium equivalent) per household, less than 5 percent below its 1955 average compared with about 10 percent in other regions.

Use of fats and oils as a total remained the same in the Northeast but dropped 10 to 20 percent in the other regions. The shift to oils did not compensate for the shift away from fats.

The Northeast was the only region with higher consumption of flour and cereal in 1965 than 1955, about a 10-percent increase. The West and North Central had more than 10-percent decreases and the South about a 35-percent drop. Countering this trend was an upswing in use of bakery products. Consumption rose about 25 percent in the

South, 20 percent in the Northcast, 10 percent in the North Central, and 2 percent in the West from 1955 to 1965.

Use of meat in the West remained about the same in 1965 as in 1955, but rose about 10 percent during the decade in the other regions. Use of poultry increased about 10 percent in the Northeast, 20 percent in the South and North Central, and nearly 40 percent in the West during this same period. Fish consumption, which little more than held its 1955 level in the South, dropped roughly 15 percent in the North Central and 5 percent in the Northeast and West in 1965. Use of eggs also fell. The combined consumption of meat, poultry, fish, and eggs, however, increased in each region, from 2 percent in the West to 10 percent in the South.

Consumption of sugar and sweets dropped about 15 percent in each region except in the Northeast where it was unchanged from the earlier period. Decreases were primarily in sugar and jelly and jam.

In general, fresh and dried vegetables and fruit and commercially frozen fruit decreased and commercially canned and frozen vegetables increased in use from 1955 to 1965 in each region. Consumption of all vegetables including potatoes decreased 8 percent in the Northcast, 13 percent in the West, and 10 percent in the North Central and South. Consumption of all fruit decreased roughly 6 percent in the South, 11 percent in the West, and 15 percent in the North Central. Thus the combined consumption of vegetables and fruit decreased the least in the Northeast and the most in the North Central and West. Of all four regions, however, the South used the smallest amount of vegetables and fruit in both 1965 and 1955.

The direction of change and percentage change in 1965 over 1955 for selected items of food that had an important impact on the changes in consumption of food groups follow:

Food	Percent ch	ange in hou from 1955		nsumption					
FOOD	Northeast	North Central	South	West					
	Increases								
Nonfat dry milk	140 92 64 30 20	100 100 66 22 27	138 117 79 56	129 19 48 14 37					
Commercially frozen: Potatoes	150 30 140 381 86 1,036	375 21 60 267 77 764 57	1,300 62 83 167 68 756 67	250 25 46 575 96 457 45					
Fresh fluid milk	12 23 26 30 31 7 18 18	Decres 18 42 34 35 31 20 18 17	23 40 54 37 50 15	24 46 40 49 42 22 25 15					
FreshCommercially frozen	5 64	21 50	11 43	15 38					

Changes in food consumption between 1955 and 1965 may reflect any of a number of factors: Shifts to new foods and more quickly prepared convenience foods; response to new knowledge about the relation of diet to health--specifically calories and fats; trend to more frequent eating through snacking; changes in the age distribution of the popula-

tion--more children and youths and more older persons; greater mobility of the population creating a blending of food habits; and marked changes in production, processing, and marketing of foods. Effect of changes in food prices and in family income need further study.

INTRODUCTION

This report presents data for spring 1965 from the nationwide survey of household food consumption made by the U.S. Department of Agriculture during April 1965 through March 1966. The study is part of the Department's continuing research program on the food and nutrition of man started at the turn of the century. Through the years, the Department has contributed much to the knowledge of American food habits by collecting information about the kinds and quantities of food people eat as well as the amount of money they spend for food. Dietary levels of different groups within the population are then computed from the nutrient content of the reported food. This information serves many needs.

- Congress, the Department of Agriculture, and other Federal agencies use these data to develop and administer public programs and policies that relate to the production, marketing, and distribution of food.
- Research and development laboratories, food manufacturers, and food industries use these data to bring the processing and marketing of food closer to the needs and wants of consumers.
- Nutritionists, home economists, educators, and welfare workers use these
 data to assess the current nutritive value of diets of the population and to
 develop guidelines and programs for improving nutrition levels in the United
 States.

Thus, nationwide food consumption surveys are benchmarks to measure past progress and to point to future programs, developments, and policies that will benefit the consumer.

To obtain information on the Nation's dietary situation, the Department has made five nationwide surveys of food consumption over the past 30 years—in1936, 1942, 1948 (urban only), 1955, and 1965-66. The chief difference between the 1965-66 nationwide survey and the earlier surveys is that the 1965-66 survey is the only one which covered all four seasons of the year. As a result, seasonal data on household food consumption will be available for 1965-66. Approximately 15, 000 housekeeping households of one or more members were interviewed in 1965-66. Of these, about 7, 500 households were interviewed in the spring of 1965. In each of the following three seasons (summer 1965, fall 1965, and winter 1966), 2, 500 other households were surveyed.

The spring portion of the 1965-66 survey also included information on a day's food intake of individuals in addition to the regular household food consumption data. Thus, information on the food intake and nutritive content of the diets of men, women, boys, girls, and infants will be available for the first time on a nationwide basis.

Households were selected to represent housekeeping households in each of the four Census regions during each of the four seasons. Metropolitan areas, cities of various sizes, rural farm and nonfarm areas in conterminous United States were surveyed. To permit adequate farm coverage, farm-operator households were over-sampled. Persons living on military reservations, in institutions, and in rooming and boarding houses were excluded.

The data were collected by personal interview with household members, usually the homemaker. Experienced interviewers were schooled in the collection of data for this survey. They used a detailed food list to help the homemaker recall the kinds, quantities, and costs of foods (including alcoholic and other beverages) used at home during the 7 days preceding the interview as well as to obtain information about those who ate the food. Expenditures for meals and snacks away from home paid for by family members were also obtained. In addition to family income, other household data collected for classification purposes included the age, education, and employment of the homemaker. Households in the spring sample were also asked about the kinds of food that were home produced and home preserved during 1964. Households in the winter sample were asked about the use of the fat on the beef and pork consumed during the survey week.

In general, these basic data on food consumption can be compared with data from the Department's earlier surveys and with those from other large surveys of food purchases. Although there may be a substantial difference between the purchase and consumption of a food for an individual family during a week, average purchases for a large number of families tend to equal average consumption. As in earlier USDA surveys, food consumption is measured at the level at which the foods come into the kitchen. Thus, the data in these reports should be considered as economic consumption rather than as physiological consumption.

Because other Federal agencies and private organizations need the information on food consumption, the first five reports on the survey data are being released with a minimum of descriptive information and with only highlights of findings.

Weights were used to compensate for expanded sample of farm households (See Sample Analysis, "Collection Counts"). In this region, farm households have a weight of 1/5.

² Households not classified by income excluded from percent distribution but shown in parentheses as percent of total.

³ Households not classified by income are mainly those not providing requested data but 23 actual households are included (10 urban, 7 rural nonfarm and 6 farm) in which there was no economic family in the week preceding the interview or in 1964.

TABLE NOTES

part	The following notes are designed for use with tables 2 through 27. For the most, the notes provide the type of information usually found in footnotes at the end of	Col.	Heading	Notes
indi or n	vidual tables. <u>General Notes</u> contain information and explanations applicable to all nost tables. <u>Specific Notes</u> refer to a particular table, group of columns, or single mn of a table.	3-5	Percent of households reporting	All households reported expenditures for food used at home; therefore, the percent of households reporting food in columns 3, 4, 5 (100.0) has been omitted.
	General Notes	4-9	At home	Including packed lunches and other food carried from home. See Definitions and Expla-
1.	"All households" includes households not classified by income.			nations, "Money value of food used at home."
2.	Average quantity and money value per household and percent of households are based on all households in the cell. See table 1 for cell counts.	8	Donated	Federally donated food only. See <u>Definitions</u> and <u>Explanations</u> .
3.	Component items may not cross-add to totals because of rounding.	12	Snacks	Between-meal food and beverages; supplements to packed lunches.
4.	The asterisk (*) indicates some but less than 0.005 pound, quart, dozen; 0.005 dollar; 0.05 percent.	13	Meals not bought	See <u>Definitions and Explanations</u> , "Food away from home not bought."
5.	The symbol # indicates that there is a specific note.		TABLE 3FOO	D GROUP TOTALS
6.	See table 3 for food group totals for tables 4 through 21.			detailed data. **Indicates that data are not
7.	Homemade mixtures on hand at the beginning of the 7-day period if used during the survey week are included in prepared form rather than as ingredients. Data for all other foods are as they were brought into the kitchen. See <u>Definitions and Explanations</u> , "Food at home."	2	available. Milk, cream, cheese (calcium equivalent)	See <u>Definitions and Explanations</u> , "Milk products measurescalcium equivalent."
8.	Donated food is included intables 3 through 21. See table 22 for separate data on donated foods.	7	Poultry, fish	Also shellfish.
9.	Commercially canned food includes baby food. See table 23 for separate data on baby food.	8	Eggs (fresh equivalent)	See <u>Definitions and Explanations</u> , "Eggs fresh equivalent."
10.		11	Fresh vegetables	Other than potatoes, sweetpotatoes. Also home-canned and home-frozen.
11.	Mention of a trade name does not constitute an endorsement of the product by the U.S. Department of Agriculture to the exclusion of	12	Fresh fruit	Also home-canned and home-frozen.
	products not mentioned.	15	Juice: Vegetable, fruit	Single-strength equivalent of frozen concentrated juice.
	Specific Notes	16	Dried vegetables, fruit	Also home-canned and home-frozen.
	TABLE 2MONEY VALUE OF FOOD, BY SOURCE	17	Beverages	Data for tea are for purchases rather than consumption.
Col		18	Soup, other mixtures	Including baby food mixtures except for-
No.	Heading Notes	10	Note and the	
	Money value of food includes money value of alcoholic and other beverages.	19	Nuts, condiments, leavenings	Data for seasonings are for purchases rather than consumption. For selected sea-
2	Househa d size In equivalent persons; 21 meals at home equal one person.			sonings such as extracts, flavors, and meat sauce, quantity is not included.

COMPARISON WITH 1955 HOUSEHOLD FOOD CONSUMPTION SURVEY

A major purpose of the 1965-66 survey was to compare food consumption in the spring of 1965 with information collected in the 1955 survey. In general, the methods followed in the two surveys were the same.

Some differences that might affect comparability follow:

-- Modification of the schedule

- a. To facilitate machine computation, the design of the 1965 schedule was different from that of the questionnaire used in 1955.
- b. In 1955, a figure for income was derived from a detailed set of questions asked by the interviewer. For the 1965 survey, a "global" figure for income was obtained by asking the respondent to estimate 1964 money income after first asking about specific sources of income.
- c. Separate information on donated food issued to low-income families was not obtained in 1955. In 1965, separate data were obtained on the quantity of donated food received and on the percent of families participating in the food distribution program.

d. The 1955 questionnaire contained a section on home-baking. This was not included in the 1965 questionnaire. On the other hand, the 1965 survey obtained data on the food intake of individuals--a section which was not included in the 1955 survey. Both sets of questions helped to remind the respondent of foods omitted from the household portion of the questionnaire, but each did so in a different manner.

-- Change in the data collected

In 1965, data on the quantity and money value of alcoholic beverages used were collected whereas in 1955, only the expense for purchases within the survey week was obtained.

-- Treatment of households of single individuals

The 1955 data by income were for households of two or more persons. In addition, the data for one-person households were shown separately on each table. In 1965, the income classifications include all households regardless of size.

^{*}Less than 0.005 cents.

^{1/2} The 1965 money value is for the quantity of alcoholic beverages used during the survey week. The 1955 figure is the expense for purchases during the survey week.

-- Exclusion of the money value of food used by boarders and help

In 1955, the money value of food used at home was adjusted to exclude the value of food used by boarders and farm help. In 1965, this adjustment was not made because the effect had been found to be very slight. Therefore, the money value of food at home in table 2 of this report should be compared with data in table 3 in the South Report No. 4, 1955.

-- Difference in the handling of homemade mixtures

Homemade mixtures on hand at the beginning of the 7-day period and used during the survey week in 1965 are included in prepared form whereas in 1955, such mixtures were included as individual ingredients.

-- Changes in groupings of food items

- a. "Half and half" is now with "Cream"; in the 1955 report, it was with "Fresh fluid milk," (table 6, col. 7). "Sherbet" is now with "Frozen milk dessert"; in 1955, it was with "Ices" (table 21, col. 27).
- b. "Baby cereal" is now included with the "Cold breakfast cereal total" (table 6, col. 17), and it is also shown separately in this report, (table 23, col. 13). In the 1955 report, "Baby cereal" was included with the total for "Other cereal" (rice, cornmeal, macaroni, etc.) (table 8, col. 20) and it was also shown separately (table 8, col. 21).
- c. All data on baby foods are now reported together in one table (table 23) as well as being included in appropriate columns of earlier tables. In 1955, baby vegetables and fruit were kept separate from regular vegetables and fruit. (See Report 4, table 17, cols. 13 and 27.)

The quantity and money value of food groups and selected food items from the 1965 and the 1955 surveys are presented in table 28. Where necessary, the 1955 groupings have been adjusted to make them comparable to the 1965 food groupings.

SAMPLE ANALYSIS

Description of Universe

Information for the 1965-66 study of consumption of food from household food supplies was collected by interviewing 15,101 households of one or more members. The households were scientifically selected to represent those in metropolitan areas, cities of various sizes, and rural farm and nonfarm areas in all parts of the United States except Alaska and Hawaii. Excluded from the survey were approximately 5 percent of the population who were not housekeeping: 1.5 percent were not visited because they were living in group quarters such as rooming houses, hospitals, and prisons; the other 3-4 percent were excluded when an initial screening indicated that they were inhouseholds in which no member ate as many as 10 meals from the home-food supplies. Interviewing began in all regions on April 3, 1965, and continued until April 2, 1966. Each family was asked to report on its food consumption for the 7 days preceding the interview.

Design

The 15, 101 interviews were allocated by time and place so that optimum use could be made of the schedules for the various kinds of analysis units. Thus half the schedules (7, 532) were collected in spring 1965 and the other half distributed equally among the three other seasons (summer and fall 1965 and winter 1966).

The sample design provided for a national self-weighting basic sample plus a supplementary farm sample which overweights the number of farm households in the approximate proportion of 5:1. The weights used for unifying the schedules to appropriate proportions are shown under "Collection Counts."

The households to be interviewed were selected in accordance with a multistage area sample design with added control by season.

Delineation of 106 strata with equal number of households was accomplished by dividing conterminous United States into 27 classes--nine geographic divisions by three population concentration classes. 2/ The latter is essentially the division between Standard Metropolitan Statistical Areas (SMSA) and nonmetropolitan areas with a further breakdown in the SMSA's between the central cities of 50,000 or more and the rest of the areas. Within each of the 27 classes, State Economic Areas 3/were identified and combined into strata containing approximately 1/2 million households. The strata allocation is as follows:

Region and division	Total	Statist: Central	Metropolitan ical Area Outside central city	Nonmetro- politan area
Total	106	40	28	38
Northeast: New England Middle Atlantic	6 20	2 10	2 6	2 4
North Central: East North Central West North Central	10 20	8 2	6 2	6 6
South: South Atlantic East South Central West South Central	16 7 9	14 2 14	1 1	8 4 4
West: Mountain Pacific	5 13	2 6	1 5	2 2

Central cities are entirely urban. The rest of the SMSA's and the nonmetropolitan areas are both urban and rural.

For the basic sample, 144 first-stage units of expected size of 10,000 households were selected at random--one from each of the 68 SMSA strata (40 in the central city and 28 outside) and two from each of the 38 nonmetropolitan strata as shown by region in the following table:

Region	Total	Statist: Central	Metropolitan ical Area Outside central city	Nonmetro- politan area
Total	144 32 42 48 22	12 10 10 8	28 8 8 6 6	76 12 24 32 8

Within each first-stage unit, second-stage units of 30 expected housing units were selected, also at random--approximately 19 from each SMSA stratum and 9 or 10 from each nonmetropolitan stratum. There were approximately 2,000 second-stage units in the basic sample.

Each of the second-stage units was visited and a list of housing units prepared. By systematic selection, a sufficient number of housing units were chosen for interview in the spring to yield an average of three schedules per second-stage unit after allowing for vacancies and ineligibles or otherwise nonparticipating households. The lists were updated in the summer, fall, and winter, and a sufficient number of households were chosen to yield an average of one schedule per second-stage unit in each of these seasons. Selection of housing units from the second-stage units was independent for each season.

The farm household universe is relatively small. If it had been represented in its true proportion, there would not have been enough schedules for analysis. Therefore, a supplementary sample of farm households was added to the basic sample. This supplement of about 500 second-stage units was drawn from the 104 previously selected first-stage units in the nonmetropolitan areas and the parts of the SMSA's outside the central cities. These second-stage units were allocated between the metropolitan and nonmetropolitan sectors in proportion to the estimated number of farm households, but selection was made with probability proportionate to total number of households. Field collection showed that "total households" was not a good indicator of farm household distribution within the metropolitan sector. To prevent underrepresentation in this sector, 40 second-stage units were withdrawn and 35 others were doubled in size.

^{2/} Divisions, Standard Metropolitan Statistical Areas and cities as defined by U.S. Bureau of the Census in U.S. Census of Population: 1960.

^{3/} U.S. Bureau of the Census, State Economic Areas: 1951.

No substitutes were provided for households unable or unwilling to participate in the survey. Interviewers were instructed to call as many as three times, if necessary, to make the original contact in rural places, four times in urban places, and six times in 281 second-stage-sample units in 15 large cities where collection difficulties were anticipated.

Collection Counts, Spring 1965

In the South, 2,651 households provided schedules in the spring (table 1). These are equivalent to a self-weighting sample of 1,985. The distributions by urbanization are as follows:

	Schedule	Weighted
	counts	counts
Southall urbanizations	2,651	1, 985
Urban	1,199	1,199
Rural nonfarm	619	619
Rural farm	833	166.6

The weighted counts differ from the schedule counts in the farm sector and therefore in the total sample. Weights are needed to compensate for oversampling of farm households. The design called for five times as many farm schedules as required by their relative number in the population. To provide the proper proportion for analysis, each farm schedule was assigned a weight of 0.2.

The data shown in this report were computed from all schedules, each with its appropriate weight.

In the collection process, not all housing units yielded schedules. Sometimes no one was contacted even after repeated visits. In some households no member ate at least 10 meals from the home-food supply during the 7 days preceding the interview; therefore, they were ineligible for the survey. Some eligible families were unwilling or unable to participate. The eligible nonparticipants constituted about 20 percent of the eligible households in this survey for all regions combined. Many past studies have shown that nonparticipation rates are higher in urban than rural communities. Such information and information on the count of households never reached are not available for this survey.

Appraisal, Spring 1965

When collection counts of supplementary farm schedules revealed that distribution of "total households" was not a good indicator of farm household distribution, adjustment was made by withdrawing a few segments and enlarging a few others. This affected only 7 percent of the supplementary farm sample segments in the South and was intended to avoid underrepresentation of the farms in the SMSA's. No information on this problem is available for the nonmetropolitan sector. The net result could be slight overrepresentation of farms in the more densely populated areas of both sectors.

How well the sample of scheduled households represents the universe as designed is usually appraised in three steps. First, a comparison is made between the sample of all households visited (whether or not they are eligible or participate) with some outside source of data, such as Census reports, to see if there is a good cross section of the universe of all households. Second, a comparison is made between the eligible and ineligible households to show whether the households declared ineligible are different from those eligible. Third, a comparison is made between the eligible participants and eligible nonparticipants to evaluate possible bias of nonresponse. These comparisons provide links between scheduled households and all households.

Because the data needed for these comparisons are not available, the appraisal in this report is restricted to comparison of the characteristics of scheduled households with Census reports relating to all households (table 29). Definitions are not strictly comparable. A Census household consists of occupants of a housing unit, whereas in this survey, a household was not scheduled unless some member ate at least 10 meals from the household food supply during the 7 days preceding the interview. Most of the Census data refer to 1960 and changes during the subsequent 5 years are to be expected.

The sample in the South overrepresents homeowners and nonwhite urban households. Also some urban households (about 6 percent of the 1965 total) are included with the rural nonfarm because recently developed areas reclassified from rural to urban by the Census had not been updated for the survey sampling frame. The effect of the omission from the urban data is probably not great, but the rural nonfarm consumption data may be somewhat biased toward urban patterns. Comparison of other characteristics (table 29) does not indicate bias in the food consumption data.

Although there are gaps in information about the nonparticipants, the characteristics of the participants are consistent with characteristics of all households, and the sample reasonably may be considered representative of housekeeping households in the South.

^{7 1964} Census of Agr. Preliminary Report, Series AC 64-Pl, 1966.

All Urbanizations

See "Urbanization."

Bought Food

See "Source of Food,"

Donated Food

Federally donated food only. See "Source of Food."

Eggs Fresh Equivalent

Quantity of frozen, dried, or liquid eggs without shell, whether the whole egg, whites, or yolks only, converted to the weight of equivalent amounts of eggs in shell.

Eligible Households

Those with at least one person having 10 or more meals from the household food supply during the 7 days preceding the interview.

Family

Persons living alone or a group of persons living together and drawing from a common fund for the major items of expense, such as food, housing, and automobile. Unmarried sons and daughters of any age if living at home were considered part of the family. Other persons, related or unrelated, living with the family were included only if they drew from a common family fund for the major items of expense.

Any persons who were usually part of the family but who were temporarily away from home--at school, at work, in the hospital, or on vacation--were included with the family. However, sons or daughters in the Armed Forces who were quartered away from home on military installations were not considered part of the family.

Farm Household

A household that included a farm operator at the time of interview.

Farm Operator

A person who at the time of the interview made the decisions and controlled the operation of property consisting of (1) 10 or more acres yielding sales of at least \$50 in 1964 or (2) fewer than 10 acres yielding sales of at least \$250 in 1964 or (3) land expected to yield sales in 1965 meeting either of the above specifications.

The farm operator performed the labor himself or directly supervised it. He was an individual operator or had one or more partners and either owned or rented the property by cash or cropping arrangement. The operator's dwelling unit did not have to be located on the farm property.

Food at Home

Food and beverages (alcoholic and nonalcoholic) from the household food supplies "used" during the 7 days before the date of the survey interview. This included food and beverages eaten at home, carried from the home in packed meals, thrown away, and food fed to pets. Food fed to animals raised for commercial purposes and commercial "pet" food were omitted. Food that was obtained with cash, credit, food stamps, coupons, or food vouchers, and food that was home produced, federally donated, received as a gift or payment for goods and services, or received from welfare agencies was included.

Any food from the respondent's household that was given away for use outside the home, such as food sent to sons in the military service, gifts of food donated to a church supper, or food given to household help to take home, was also excluded from food at home.

Food used at home was classified by form--fresh, commercially canned or frozen, home-canned or frozen, and dried or dehydrated. Generally, the food used at home was reported in the form in which it was brought into the kitchen.

Concerning homemade mixtures, the period of preparation relative to the interview date determined the procedure for recording them on the schedule. If the mixture used was prepared from home food supplies during the 7 days of the survey week, the kind and amount of each ingredient were recorded. For example, a homemade cake prepared any time within the survey week was included with quantities of flour, eggs, sugar, fat, and milk. But a homemade mixture used during, but prepared before, the survey week was recorded in the name of the product in the same way as a commercially prepared mixture was recorded. To illustrate, a cake that was prepared at home on any day before the survey week, or a bakery cake that was brought from the store into the kitchen, was entered on the schedule as a ready-to-eat cake.

If home-canned or home-frozen vegetables and fruit and home-preserved jelly, jam, pickles, or relishwere processed before the survey week they were also recorded in the same way as commercially prepared mixtures. However, when the canned, frozen, or preserved food was made at homeduring the 7-day period, only the ingredients of the portion used during that period were recorded.

Regardless of the time of preparation, homemade butter, cheese, cream, and buttermilk were always reported as the products rather than as ingredients.

Food at Home Not Bought

Food used at home that was home produced, donated, and received as a gift or instead of pay. See "Source of Food."

Food Away From Home

Any food and beverage (alcoholic and nonalcoholic) in meals and snacks purchased by the family for themselves and their guests away from home during the week. The expense for such food and beverages included sales tax and tips. Food eaten by the family in other homes or elsewhere as guests or employees for which no family expense was involved was not included in expense for food away from home. See "Food Away From Home Not Bought."

Food Away From Home Not Bought

The number of meals with no family expense, that is, meals eaten by the family in other homes or elsewhere as guests or employees.

Home-Produced Food

See "Source of Food."

Household

A family or a group of unrelated persons who lived together and their guests, boarders, and hired help.

Household Size

The total number of meals served to all persons in the household from family food supplies divided by 21 (based on three meals a day for 7 days for one person) to obtain the household size in equivalent persons. When meals reported eaten at home and away from home did not add to 21 meals for each person, the skipped meals were distributed as bought, free, and from household food supplies in the same proportion as the reported meals. The count of equivalent persons was not adjusted for between-meal snacks or additional meals, such as those served to invalids or young children. However, the meals served to guests, boarders, and hired help were included.

Lunches carried from home, but supplemented by other food purchased, received as a gift, or received instead of pay, were counted as one-half meal at home and one-half meal from one of the other sources; lunches supplemented only by beverages were counted as full meals at home.

Refreshments served to guests were also counted in the total meals from household food supplies, but were not given the same value as a full meal. Servings of a single food or two, for example, a glass of milk or a cup of coffee and a doughnut, were considered light refreshments and counted as one-fourth meal for each guest. More than two refreshment items served at one time, such as ice cream, cake, and coffee, were counted as one-half meal for each guest served. Any refreshments served to persons who were part of the family were not counted unless they substituted for a regular meal.

Milk Products Measures

Calcium equivalent—Quantity of whole fluid milk to which dairy products (except butter) are equivalent in calcium content. The chief source of data on the calcium content of the various dairy products was "Composition of Foods—Raw, Processed, Prepared," U.S. Department of Agriculture, Agriculture Handbook No. 8, December 1963.

Fat content and nonfat solids content—Quantity of milk fat (in pounds) and of milk nonfat solids (in pounds) contained in milk, cream, ice cream, and cheese used by households in a week. The source of most of the factors was "Conversion Factors and Weights and Measures for Agricultural Commodities and Their Products," U.S. Department of Agriculture Statistical Bulletin No. 362, June 1965.

Money Income

Respondent's estimate of the family's 1964 money income (after deduction of State and Federal income taxes) within one of the income classes grouped by \$1,000 increments up to \$12,000 and by broader income ranges above \$12,000 up to \$25,000 or more.

Money Value of Food Used at Home

Price paid for bought food "used" in the survey week regardless of the time of purchase. Sales tax was excluded. Bought food with unreported prices, food produced at home, and food received as a gift or instead of pay were valued at prices paid for similar items by other families in the same region and urbanization. Federally donated foods were valued at average retail prices from the Bureau of Labor Statistics commodity index for the United States.

Not Classified by Income

Households that were not families at the time of the survey or for the year 1964 and households in which respondents were either unable or unwilling to give information about income. See "Family."

Rural Farm

See "Urbanization."

Rural Nonfarm

See "Urbanization,"

Source of Food

Classification of food as bought, home produced, federally donated, or received as a gift or instead of pay.

Bought--Food received for cash, on credit, with Federal food stamps (coupons), or with vouchers. Also includes home-canned, home-frozen, and home-baked goods if the major ingredient was purchased.

Home-produced--Food raised for home use and food obtained by hunting, fishing, and gathering from the wild.

Donated--Food from USDA's Direct Distribution Program issued to low-income families by State and local welfare agencies.

Gift or pay--Food received as a gift or from an employer.

Spring

The months of April, May, and June 1965.

Urban

See "Urbanization."

Urbanization

Distinction between urban and rural households was based on the size of place in which the dwelling was located. Within the rural category, distinction between farm and nonfarm households was based on the presence of a farm operator. Definitions are those used by the Department of Commerce for the Population Census (1960) and the Agriculture Census (1964).

All households--Composite of urban, rural nonfarm, and rural farm households appropriately weighted.

Urban-Households in places with at least 2, 500 inhabitants and in closely settled fringe areas surrounding cities of 50,000 or more inhabitants.

Rural nonfarm--Households outside of urban places without a farm operator.

Rural farm--Households outside of urban places with a farm operator.

Weights

See "Sample Analysis."
